

A DIGITAL CAMERA SYSTEM HAVING MOTION DEBLURRING MEANS Field of the Invention

The present invention relates to digital image processing and in particular discloses A Camera System Having Motion Deblurring Means.

Further the present invention relates to the field of digital image cameras and in particular discloses a camera system having motion blur compensating means.

Background of the Invention

Motion blur in the taking of images is a common significant problem. The motion blur normally occurs as a result of movement of the camera while taking the picture or otherwise as a result of movement of objects within an image.

As a result of motion blur, it is often the case that the image taken is non optimal.

Summary of the Invention

It is an object of the present invention to provide a camera system having the ability to overcome the effects of motion blur.

In accordance with the first aspect of the present invention there is provided a camera system for outputting deblurred images, said system comprising;

an image sensor for sensing an image; a velocity detection means for determining any motion of said image relative to an external environment and to produce a velocity output indicative thereof; a processor means interconnected to said image sensor and said velocity detection means and adapted to process said sensed image utilising the velocity output so as to deblurr said image and to output said deblurred image.

Preferably, the camera system is connected to a printer means for immediate output of said deblurred image and is a portable handheld unit. The velocity detection means can comprise an accelerometer such as a micro-electro mechanical (MEMS) device.

Brief Description of the Drawings

Notwithstanding any other forms which may fall within the scope of the present invention, preferred forms of the ART34US

invention will now be described, by way of example only, with reference to the accompanying drawing in which:

Fig. 1 illustrates a schematic implementation of the preferred embodiment.

Description of Preferred Embodiments

The preferred embodiment is preferably implemented through suitable programming of a hand held camera device such as that described in Australian Provisional Patent Application No. P07991 filed 15 July, 1997 entitled "Image Processing Method and Apparatus (ART01)", in addition to Australian Provisional Patent Application entitled "Image Processing Method and . Apparatus (ART01a)" filed concurrently herewith by the present applicant, the content of which is hereby specifically incorporated by cross reference.

The aforementioned patent specifications disclose a camera system, hereinafter known as an "Artcam" type camera, wherein sensed images can be directly printed out by an internal Artcam portable camera unit. Further, the aforementioned specification discloses means and methods for performing various manipulations on images captured by the camera sensing device leading to the production of various effects in any output image. The manipulations are disclosed to be highly flexible in nature and can be implemented through the insertion into the Artcam of cards having encoded thereon various instructions for the manipulation of images, the cards hereinafter being known as "Artcards". The Artcam further has significant onboard processing power by an Artcam Central Processor unit (ACP) which is interconnected to a memory device for the storage of important data and images.

In the preferred embodiment, the Artcam device is modified so as to include a two dimensional motion sensor. The motion sensor can comprise a small micro-electro mechanical system (MEMS) device or other suitable device leave to detect motion in two axes. The motion sensor can be mounted on the camera device and its output monitored by the Artcam central processor device which is disclosed in the afore-mentioned patent specifications.

Turning now to Fig. 1, there is illustrated a schematic of the preferred arrangement of the preferred embodiment. accelerometer 1 outputs to the Artcam central processor 2 which also receives the blurred sensed image from the CCD device. The Artcam central processor 2 utilises the accelerometer readings so as to determine a likely angular velocity of the camera when the picture was taken. This velocity factor is then utilised by a suitably programmed Artcard processor 2 to apply a deblurring function to the blurred sensed image 3 thereby outputting a deblurred output image 4. The programming of the Artcard processor 2 so as to perform the deblurring can utilise standard algorithms known to those skilled in the art of computer programming and digital image restoration. example, reference is made to the "Selected Papers on Digital Image Restoration", M. Ibrahim Sezan, Editor, SPIE Milestone series, volume 74, and in particular the reprinted paper at pages 167-175 thereof. Further, simplified techniques are shown in the "Image Processing Handbook", second edition, by John C. Russ, published by CRC Press at pages 336-341 thereof.

It would be therefore obvious to the person skilled in the art that many different techniques for motion blur removal can be utilised in the preferred embodiment. Additionally, other forms of motion sensors may be provided. Once the input image has been deblurred, the image is then able to be printed out by the Artcam device in accordance with the techniques as discussed in the afore-mentioned patent specification.

It would be appreciated by a person skilled in the art that numerous variations and/or modifications may be made to the present invention as shown in the specific embodiment without departing from the spirit or scope of the invention as broadly described. The present embodiment is, therefore, to be considered in all respects to be illustrative and not restrictive.

Ink Jet Technologies

The embodiments of the invention use an ink jet printer type device. Of course many different devices could be used. However presently popular ink jet printing technologies are unlikely to be suitable.

The most significant problem with thermal inkjet is power consumption. This is approximately 100 times that required for high speed, and stems from the energy-inefficient means of drop ejection. This involves the rapid boiling of water to produce a vapor bubble which expels the ink. Water has a very high heat capacity, and must be superheated in thermal inkjet applications. This leads to an efficiency of around 0.02%, from electricity input to drop momentum (and increased surface area) out.

The most significant problem with piezoelectric inkjet is size and cost. Piezoelectric crystals have a very small deflection at reasonable drive voltages, and therefore require a large area for each nozzle. Also, each piezoelectric actuator must be connected to its drive circuit on a separate substrate. This is not a significant problem at the current limit of around 300 nozzles per print head, but is a major impediment to the fabrication of pagewide print heads with 19,200 nozzles.

Ideally, the inkjet technologies used meet the stringent requirements of in-camera digital color printing and other high quality, high speed, low cost printing applications. To meet the requirements of digital photography, new inkjet technologies have been created. The target features include:

low power (less than 10 Watts)
high resolution capability (1,600 dpi or more)
photographic quality output
low manufacturing cost
small size (pagewidth times minimum cross section)
high speed (< 2 seconds per page).

All of these features can be met or exceeded by the inkjet systems described below with differing levels of difficulty. 45 different inkjet technologies have been developed by the

Assignee to give a wide range of choices for high volume manufacture. These technologies form part of separate applications assigned to the present Assignee as set out in the table below.

The inkjet designs shown here are suitable for a wide range of digital printing systems, from battery powered one-time use digital cameras, through to desktop and network printers, and through to commercial printing systems

For ease of manufacture using standard process equipment, the print head is designed to be a monolithic 0.5 micron CMOS chip with MEMS post processing. For color photographic applications, the print head is 100 mm long, with a width which depends upon the inkjet type. The smallest print head designed is IJ38, which is 0.35 mm wide, giving a chip area of 35 square mm. The print heads each contain 19,200 nozzles plus data and control circuitry.

Ink is supplied to the back of the print head by injection molded plastic ink channels. The molding requires 50 micron features, which can be created using a lithographically micromachined insert in a standard injection molding tool. Ink flows through holes etched through the wafer to the nozzle chambers fabricated on the front surface of the wafer. The print head is connected to the camera circuitry by tape automated bonding.

Cross-Referenced Applications

Tables of Drop-on-Demand Inkjets

Eleven important characteristics of the fundamental operation of individual inkjet nozzles have been identified. These characteristics are largely orthogonal, and so can be

elucidated as an eleven dimensional matrix. Most of the eleven axes of this matrix include entries developed by the present assignee.

The following tables form the axes of an eleven dimensional table of inkjet types.

Actuator mechanism (18 types)

Basic operation mode (7 types)

Auxiliary mechanism (8 types)

Actuator amplification or modification method (17 types)

Actuator motion (19 types)

Nozzle refill method (4 types)

Method of restricting back-flow through inlet (10 types)

Nozzle clearing method (9 types)

Nozzle plate construction (9 types)

Drop ejection direction (5 types)

Ink type (7 types)

The complete eleven dimensional table represented by these axes contains 36.9 billion possible configurations of inkjet nozzle. While not all of the possible combinations result in a viable inkjet technology, many million configurations are viable. It is clearly impractical to elucidate all of the possible configurations. Instead, certain inkjet types have been investigated in detail. These are designated IJ01 to IJ45 above.

Other inkjet configurations can readily be derived from these 45 examples by substituting alternative configurations along one or more of the 11 axes. Most of the IJ01 to IJ45 examples can be made into inkjet print heads with characteristics superior to any currently available inkjet technology.

Where there are prior art examples known to the inventor, one or more of these examples are listed in the examples column of the tables below. The IJ01 to IJ45 series are also listed in the examples column. In some cases, a printer may be listed more than once in a table, where it shares characteristics with more than one entry.

Suitable applications include: Home printers, Office network printers, Short run digital printers, Commercial print systems, Fabric printers, Pocket printers, Internet WWW printers, Video printers, Medical imaging, Wide format printers, Notebook PC printers, Fax machines, Industrial printing systems, Photocopiers, Photographic minilabs etc.

The information associated with the aforementioned 11 dimensional matrix are set out in the following tables:

ACTUATOR MECHANISM (APPLIED ONLY TO SELECTED INK DROPS)

Actuator Mechanism	Description	Advantages	Disadvantages	Examples
Thermal bubble	An electrothermal heater heats the ink to above boiling point, transferring significant heat to the aqueous ink. A bubble nucleates and quickly forms, expelling the ink. The efficiency of the process is low, with typically less than 0.05% of the electrical energy being transformed into kinetic energy of the drop.	 Large force generated Simple construction No moving parts Fast operation Small chip area required for actuator 	 High power Ink carrier limited to water Low efficiency High temperatures required High mechanical stress Unusual materials required Large drive transistors Cavitation causes actuator failure Kogation reduces bubble formation Large print heads are difficult to fabricate 	 Canon Bubblejet 1979 Endo et al GB patent 2,007,162 Xerox heater-in-pit 1990 Hawkins et al USP 4,899,181 Hewlett-Packard TIJ 1982 Vaught et al USP 4,490,728
Piezoelectric	A piezoelectric crystal such as lead lanthanum zirconate (PZT) is electrically activated, and either expands, shears, or bends to apply pressure to the ink, ejecting drops.	 Low power consumption Many ink types can be used Fast operation High efficiency 	 Very large area required for actuator Difficult to integrate with electronics High voltage drive transistors required Full pagewidth print heads impractical due to actuator size Requires electrical poling in high field strengths during manufacture 	 Kyser et al USP 3,946,398 Zoltan USP 3,683,212 1973 Stemme USP 3,747,120 Epson Stylus Tektronix 104

Strictive	An electric field is used to activate electrostriction in relaxor materials such as lead lanthanum zirconate titanate (PLZT) or lead magnesium niobate (PMN).	 Low power consumption Many ink types can be used Low thermal expansion Electric field strength required (approx. 3.5 V/µm) can be generated without difficulty Does not require electrical poling 	 Low maximum strain (approx. 0.01%) Large area required for actuator due to low strain Response speed is marginal (~ 10 μs) High voltage drive transistors required Full pagewidth print heads impractical due to actuator size 	 Seiko Epson, Usui et all JP 253401/96 1J04
Ferroelectric	An electric field is used to induce a phase transition between the antiferroelectric (AFE) and ferroelectric (FE) phase. Perovskite materials such as tin modified lead lanthanum zirconate titanate (PLZSnT) exhibit large strains of up to 1% associated with the AFE to FE phase transition.	 Low power consumption Many ink types can be used Fast operation (< 1 µs) Relatively high longitudinal strain High efficiency Electric field strength of around 3 V/µm can be readily provided 	 Difficult to integrate with electronics Unusual materials such as PLZSnT are required Actuators require a large area 	◆ IJ04
Electrostatic	Conductive plates are separated by a compressible or fluid dielectric (usually air). Upon application of a voltage, the plates attract each other and displace ink, causing drop ejection. The conductive plates may be in a comb or honeycomb structure, or stacked to increase the surface area and therefore the force.	 Low power consumption Many ink types can be used Fast operation 	 Difficult to operate electrostatic devices in an aqueous environment The electrostatic actuator will normally need to be separated from the ink Very large area required to achieve high forces High voltage drive transistors may be required Full pagewidth print heads are not competitive due to actuator size 	• IJ02, IJ04

BASIC OPERATION MODE

Operational mode	Description	Advantages	Disadvantages	Examples
Actuator directly pushes ink	This is the simplest mode of operation: the actuator directly supplies sufficient kinetic energy to expel the drop. The drop must have a sufficient velocity to overcome the surface tension.	 Simple operation No external fields required Satellite drops can be avoided if drop velocity is less than 4 m/s Can be efficient, depending upon the actuator used 	 Drop repetition rate is usually limited to less than 10 KHz. However, this is not fundamental to the method, but is related to the refill method normally used All of the drop kinetic energy must be provided by the actuator Satellite drops usually form if drop velocity is greater than 4.5 m/s 	 Thermal inkjet Piezoelectric inkjet 101, 102, 103, 104 106, 106, 107, 109 111, 112, 114, 116 1120, 112, 1123, 1124 1120, 1122, 1123, 1128 1125, 1126, 1127, 1128 1129, 1130, 1131, 1132 1131, 1134, 1135, 1136 1137, 1138, 1139, 1140 1141, 1142, 1143, 1144
Proximity	The drops to be printed are selected by some manner (e.g. thermally induced surface tension reduction of pressurized ink). Selected drops are separated from the ink in the nozzle by contact with the print medium or a transfer roller.	 Very simple print head fabrication can be used The drop selection means does not need to provide the energy required to separate the drop from the nozzle 	 Requires close proximity between the print head and the print media or transfer roller May require two print heads printing alternate rows of the image Monolithic color print heads are difficult 	 Silverbrook, EP 0771 658 A2 and related patent applications
Electrostatic pull on ink	The drops to be printed are selected by some manner (e.g. thermally induced surface tension reduction of pressurized ink). Selected drops are separated from the ink in the nozzle by a strong electric field.	 Very simple print head fabrication can be used The drop selection means does not need to provide the energy required to separate the drop from the nozzle 	 Requires very high electrostatic field Electrostatic field for small nozzle sizes is above air breakdown Electrostatic field may attract dust 	 Silverbrook, EP 0771 658 A2 and related patent applications Tone-Jet

	induced surface tension reduction of pressurized ink). Selected drops are separated from the ink in the nozzle by a strong magnetic field acting on the magnetic ink.	The drop selection means does not need to provide the energy required to separate the drop from the nozzle	Ink colors other than black are difficult Requires very high magnetic fields	patent applications
Shutter	The actuator moves a shutter to block ink flow to the nozzle. The ink pressure is pulsed at a multiple of the drop ejection frequency.	 High speed (>50 KHz) operation can be achieved due to reduced refill time Drop timing can be very accurate The actuator energy can be very low 	 Moving parts are required Requires ink pressure modulator Friction and wear must be considered Stiction is possible 	+ IJ13, IJ17, IJ21
Shuttered grill	The actuator moves a shutter to block ink flow through a grill to the nozzle. The shutter movement need only be equal to the width of the grill holes.	 Actuators with small travel can be used Actuators with small force can be used High speed (>50 KHz) operation can be achieved 	 Moving parts are required Requires ink pressure modulator Friction and wear must be considered Stiction is possible 	◆ IJ08, IJ15, IJ18, IJ19
Pulsed magnetic pull on ink pusher	A pulsed magnetic field attracts an 'ink pusher' at the drop ejection frequency. An actuator controls a catch, which prevents the ink pusher from moving when a drop is not to be ejected.	 Extremely low energy operation is possible No heat dissipation problems 	 Requires an external pulsed magnetic field Requires special materials for both the actuator and the ink pusher Complex construction 	• IJ10 ·

AUXILIARY MECHANISM (APPLIED TO ALL NOZZLES)

Auxiliary Mechanism	Description	Advantages	Disadvantages	Examples
None	The actuator directly fires the ink drop, and there is no external field or other mechanism required.	 Simplicity of construction Simplicity of operation Small physical size 	 Drop ejection energy must be supplied by individual nozzle actuator 	 Most inkjets, including piezoelectric and thermal bubble. 1101-1107, 1109, 1111 1112, 1114, 1120, 1122 1123-1145
Oscillating ink pressure (including acoustic stimulation)	The ink pressure oscillates, providing much of the drop ejection energy. The actuator selects which drops are to be fired by selectively blocking or enabling nozzles. The ink pressure oscillation may be achieved by vibrating the print head, or preferably by an actuator in the ink supply.	 Oscillating ink pressure can provide a refill pulse, allowing higher operating speed The actuators may operate with much lower energy Acoustic lenses can be used to focus the sound on the nozzles 	 Requires external ink pressure oscillator Ink pressure phase and amplitude must be carefully controlled Acoustic reflections in the ink chamber must be designed for 	• Silverbrook, EP 0771 658 A2 and related patent applications • IJ08, IJ13, IJ15, IJ17 • IJ18, IJ19, IJ21
Media proximity	The print head is placed in close proximity to the print medium. Selected drops protrude from the print head further than unselected drops, and contact the print medium. The drop soaks into the medium fast enough to cause drop separation.	 Low power High accuracy Simple print head construction 	 Precision assembly required Paper fibers may cause problems Cannot print on rough substrates 	• Silverbrook, EP 0771 658 A2 and related patent applications

ACTUATOR AMPLIFICATION OR MODIFICATION METHOD

Actuator amplification	Description	Advantages	Disadvantages	Examples
None	No actuator mechanical amplification is used. The actuator directly drives the drop ejection process.	 ◆ Operational simplicity 	 Many actuator mechanisms have insufficient travel, or insufficient force, to efficiently drive the drop ejection process 	 Thermal Bubble Inkjet 1101, 1102, 1106, 1107 1116, 1125, 1126
Differential expansion bend actuator	An actuator material expands more on one side than on the other. The expansion may be thermal, piezoelectric, magnetostrictive, or other mechanism.	 Provides greater travel in a reduced print head area The bend actuator converts a high force low travel actuator mechanism to high travel, lower force mechanism. 	 High stresses are involved Care must be taken that the materials do not delaminate Residual bend resulting from high temperature or high stress during formation 	 Piezoelectric 1103, 1109, 1117-1124 1127, 1129-1139, 1142, 1143, 1144
Transient bend actuator	A trilayer bend actuator where the two outside layers are identical. This cancels bend due to ambient temperature and residual stress. The actuator only responds to transient heating of one side or the other.	 Very good temperature stability High speed, as a new drop can be fired before heat dissipates Cancels residual stress of formation 	 High stresses are involved Care must be taken that the materials do not delaminate 	 ◆ IJ40, IJ41
Actuator stack	A series of thin actuators are stacked. This can be appropriate where actuators require high electric field strength, such as electrostatic and piezoelectric actuators.	 Increased travel Reduced drive voltage 	 Increased fabrication complexity Increased possibility of short circuits due to pinholes 	Some piezoelectric ink jets▶ 1J04
Multiple actuators	Multiple smaller actuators are used simultaneously to move the ink. Each actuator need provide only a portion of the force required.	 Increases the force available from an actuator Multiple actuators can be positioned to control ink flow accurately 	 Actuator forces may not add linearly, reducing efficiency 	♦ 1J12, 1J13, 1J18, 1J20 ♦ 1J22, 1J28, 1J42, 1J43

Linear Spring	A linear spring is used to transform a motion with small travel and high force into a longer travel, lower force motion.	 Matches low travel actuator with higher travel requirements Non-contact method of motion transformation 	 Requires print head area for the spring 	+ IJ15
Reverse spring	The actuator loads a spring. When the actuator is turned off, the spring releases. This can reverse the force/distance curve of the actuator to make it compatible with the force/time requirements of the drop ejection.	• Better coupling to the ink	 Fabrication complexity High stress in the spring 	• 1J05, IJ11
Coiled actuator	A bend actuator is coiled to provide greater travel in a reduced chip area.	 Increases travel Reduces chip area Planar implementations are relatively easy to fabricate. 	 Generally restricted to planar implementations due to extreme fabrication difficulty in other orientations. 	 1117, 1121, 1134, 1135
Flexure bend actuator	A bend actuator has a small region near the fixture point, which flexes much more readily than the remainder of the actuator. The actuator flexing is effectively converted from an even coiling to an angular bend, resulting in greater travel of the actuator tip.	 Simple means of increasing travel of a bend actuator 	 Care must be taken not to exceed the elastic limit in the flexure area Stress distribution is very uneven Difficult to accurately model with finite element analysis 	U10, U19, U33
Gears	Gears can be used to increase travel at the expense of duration. Circular gears, rack and pinion, ratchets, and other gearing methods can be used.	 Low force, low travel actuators can be used Can be fabricated using standard surface MEMS processes 	 Moving parts are required Several actuator cycles are required More complex drive electronics Complex construction Friction, friction, and wear are possible 	+ IJ13

Catch	I he actuator controls a small catch. The catch either enables or disables movement of an ink pusher that is controlled in a bulk manner.	 very iow actuator energy Very small actuator size 	 Complex construction Requires external force Unsuitable for pigmented inks 	017
Buckle plate	A buckle plate can be used to change a slow actuator into a fast motion. It can also convert a high force, low travel actuator into a high travel, medium force motion.	 Very fast movement achievable 	 Must stay within elastic limits of the materials for long device life High stresses involved Generally high power requirement 	 S. Hirata et al, "An Ink-jet Head", Proc. IEEE MEMS, Feb. 1996, pp 418-423. III8, IJ27
Tapered magnetic pole	A tapered magnetic pole can increase travel at the expense of force.	 Linearizes the magnetic force/distance curve 	◆ Complex construction	◆ IJ14
Lever	A lever and fulcrum is used to transform a motion with small travel and high force into a motion with longer travel and lower force. The lever can also reverse the direction of travel.	 Matches low travel actuator with higher travel requirements Fulcrum area has no linear movement, and can be used for a fluid seal 	 High stress around the fulcrum 	 ▶ 1J32, IJ36, IJ37
Rotary impeller	The actuator is connected to a rotary impeller. A small angular deflection of the actuator results in a rotation of the impeller vanes, which push the ink against stationary vanes and out of the nozzle.	 High mechanical advantage The ratio of force to travel of the actuator can be matched to the nozzle requirements by varying the number of impeller vanes 	 Complex construction Unsuitable for pigmented inks 	◆ 1J28
Acoustic lens	A refractive or diffractive (e.g. zone plate) acoustic lens is used to concentrate sound waves.	 No moving parts 	Large area requiredOnly relevant for acoustic ink jets	 1993 Hadimioglu et al, EUP 550,192 1993 Elrod et al, EUP 572,220
Sharp conductive point	A sharp point is used to concentrate an electrostatic field.	• Simple construction	 ◆ Difficult to fabricate using standard VLSI processes for a surface ejecting ink-jet ◆ Only relevant for electrostatic ink jets 	◆ Tone-jet

ACTUATOR MOTION

Actuator motion	Description	Advantages	Disadvantages	Examples
Volume expansion	The volume of the actuator changes, pushing the ink in all directions.	 Simple construction in the case of thermal ink jet 	 High energy is typically required to achieve volume expansion. This leads to thermal stress, cavitation, and kogation in thermal ink jet implementations 	 Hewlett-Packard Thermal Inkjet Canon Bubblejet
Linear, normal to chip surface	The actuator moves in a direction normal to the print head surface. The nozzle is typically in the line of movement.	 Efficient coupling to ink drops ejected normal to the surface 	 High fabrication complexity may be required to achieve perpendicular motion 	1101, 1102, 1104, 11071111, 1114
Linear, parallel to chip surface	The actuator moves parallel to the print head surface. Drop ejection may still be normal to the surface.	Suitable for planar fabrication	 Fabrication complexity Friction Stiction 	• 1112, 1113, 1115, 1133, • 1134, 1135, 1136
Membrane push	An actuator with a high force but small area is used to push a stiff membrane that is in contact with the ink.	 The effective area of the actuator becomes the membrane area 	 Fabrication complexity Actuator size Difficulty of integration in a VLSI process 	• 1982 Howkins USP 4,459,601
Rotary	The actuator causes the rotation of some element, such a grill or impeller	 Rotary levers may be used to increase travel Small chip area requirements 	 Device complexity May have friction at a pivot point 	 1105, 1108, 1113, 1128
Bend	The actuator bends when energized. This may be due to differential thermal expansion, piezoelectric expansion, magnetostriction, or other form of relative dimensional change.	 A very small change in dimensions can be converted to a large motion. 	 Requires the actuator to be made from at least two distinct layers, or to have a thermal difference across the actuator 	 1970 Kyser et al USP 3,946,398 1973 Stemme USP 3,747,120 1003, 1109, 1110, 1119 1123, 1124, 1125, 1129 1130, 1131, 1133, 1134 1135

BEGT-CO-OSOETTBO

C	

Swive	The actuator swivels around a central pivot. This motion is suitable where there are opposite forces applied to opposite sides of the paddle, e.g. Lorenz force.	 Allows operation where the net linear force on the paddle is zero Small chip area requirements 	 Inefficient coupling to the ink motion 	• IJ06
Straighten	The actuator is normally bent, and straightens when energized.	 Can be used with shape memory alloys where the austenic phase is planar 	 Requires careful balance of stresses to ensure that the quiescent bend is accurate 	 1126, 1132
Double bend	The actuator bends in one direction when one element is energized, and bends the other way when another element is energized.	 One actuator can be used to power two nozzles. Reduced chip size. Not sensitive to ambient temperature 	 Difficult to make the drops ejected by both bend directions identical. A small efficiency loss compared to equivalent single bend actuators. 	 1136, 1137, 1138
Shear	Energizing the actuator causes a shear motion in the actuator material.	 Can increase the effective travel of piezoelectric actuators 	 Not readily applicable to other actuator mechanisms 	◆ 1985 Fishbeck USP4,584,590
Radial constriction	The actuator squeezes an ink reservoir, forcing ink from a constricted nozzle.	 Relatively easy to fabricate single nozzles from glass tubing as macroscopic structures 	 High force required Inefficient Difficult to integrate with VLSI processes 	+ 1970 Zoltan USP 3,683,212
Coil / uncoil	A coiled actuator uncoils or coils more tightly. The motion of the free end of the actuator ejects the ink.	 Easy to fabricate as a planar VLSI process Small area required, therefore low cost 	 Difficult to fabricate for non-planar devices Poor out-of-plane stiffness 	 1J17, IJ21, IJ34, IJ35
Вом	The actuator bows (or buckles) in the middle when energized.	 Can increase the speed of travel Mechanically rigid 	 Maximum travel is constrained High force required 	♦ IJ16, IJ18, IJ27
Push-Pull	Two actuators control a shutter. One actuator pulls the shutter, and the other pushes it.	 The structure is pinned at both ends, so has a high out-of-plane rigidity 	 Not readily suitable for inkjets which directly push the ink 	♦ IJ18

Curl inwards	A set of actuators curl inwards to reduce the volume of ink that they enclose.	 Good fluid flow to the region behind the actuator increases efficiency 	◆ Design complexity	• iJ20, IJ42
Curl outwards	A set of actuators curl outwards, pressurizing ink in a chamber surrounding the actuators, and expelling ink from a nozzle in the chamber.	Relatively simple construction	• Relatively large chip area	◆ IJ43
Iris	Multiple vanes enclose a volume of ink. These simultaneously rotate, reducing the volume between the vanes.	 High efficiency Small chip area 	 High fabrication complexity Not suitable for pigmented inks 	+ 1122
Acoustic	The actuator vibrates at a high frequency.	 ◆ The actuator can be physically distant from the ink 	 Large area required for efficient operation at useful frequencies Acoustic coupling and crosstalk Complex drive circuitry Poor control of drop volume and position 	 1993 Hadimioglu et al, EUP 550,192 1993 Elrod et al, EUP 572,220
None	In various ink jet designs the actuator does not move.	 No moving parts 	 Various other tradeoffs are required to eliminate moving parts 	 Silverbrook, EP 0771 658 A2 and related patent applications Tone-iet

Nozzle Refill Method

Nozzle refill method	Description	Advantages	Disadvantages	Examples
Surface tension	After the actuator is energized, it typically returns rapidly to its normal position. This rapid return sucks in air through the nozzle opening. The ink surface tension at the nozzle then exerts a small force restoring the meniscus to a minimum area.	 Fabrication simplicity Operational simplicity 	 Low speed Surface tension force relatively small compared to actuator force Long refill time usually dominates the total repetition rate 	 Thermal inkjet Piezoelectric inkjet 1101-1107, 1110-1114 1116, 1120, 1122-1145
Shuttered oscillating ink pressure	Ink to the nozzle chamber is provided at a pressure that oscillates at twice the drop ejection frequency. When a drop is to be ejected, the shutter is opened for 3 half cycles: drop ejection, actuator return, and refill.	 High speed Low actuator energy, as the actuator need only open or close the shutter, instead of ejecting the ink drop 	 ◆ Requires common ink pressure oscillator ◆ May not be suitable for pigmented inks 	• 1108, 1113, 1115, 1117 • 1118, 1119, 1121
Refill actuator	After the main actuator has ejected a drop a second (refill) actuator is energized. The refill actuator pushes ink into the nozzle chamber. The refill actuator returns slowly, to prevent its return from emptying the chamber again.	 High speed, as the nozzle is actively refilled 	Requires two independent actuators per nozzle	• 1109
Positive ink pressure	The ink is held a slight positive pressure. After the ink drop is ejected, the nozzle chamber fills quickly as surface tension and ink pressure both operate to refill the nozzle.	 High refill rate, therefore a high drop repetition rate is possible 	 Surface spill must be prevented Highly hydrophobic print head surfaces are required 	 Silverbrook, EP 0771 658 A2 and related patent applications Alternative for: 1101-1107, 1110-1114 1116, 1120, 1122-1145

METHOD OF RESTRICTING BACK-FLOW THROUGH INLET

Inlet back-flow	Description	Adventages	Oicoda Contraction	
restriction			Disavallagges	Cxampies
Long inlet channel	The ink inlet channel to the nozzle chamber is made long and relatively narrow, relying on viscous drag to reduce inlet back-flow.	Design simplicityOperational simplicityReduces crosstalk	 Restricts refill rate May result in a relatively large chip area Only partially effective 	Thermal inkjetPiezoelectric inkjet1142, 1143
Positive ink pressure	The ink is under a positive pressure, so that in the quiescent state some of the ink drop already protrudes from the nozzle. This reduces the pressure in the nozzle chamber which is required to eject a certain volume of ink. The reduction in chamber pressure results in a reduction in ink pushed out	 Drop selection and separation forces can be reduced Fast refill time 	 Requires a method (such as a nozzle rim or effective hydrophobizing, or both) to prevent flooding of the ejection surface of the print head. 	 Silverbrook, EP 0771 658 A2 and related patent applications Possible operation of the following: IJ01-IJ07, IJ09- IJ12 IJ14, IJ16, IJ20, IJ22, IJ23-IJ34, IJ36- IJ41 IJ44
Baffle	One or more baffles are placed in the inlet ink flow. When the actuator is energized, the rapid ink movement creates eddies which restrict the flow through the inlet. The slower refill process is unrestricted, and does not result in eddies.	 The refill rate is not as restricted as the long inlet method. Reduces crosstalk 	 Design complexity May increase fabrication complexity (e.g. Tektronix hot melt Piezoelectric print heads). 	HP Thermal Ink Jet Tektronix piezoelectric ink jet
Flexible flap restricts inlet	In this method recently disclosed by Canon, the expanding actuator (bubble) pushes on a flexible flap that restricts the inlet.	 ◆ Significantly reduces backflow for edge-shooter thermal ink jet devices 	 Not applicable to most inkjet configurations Increased fabrication complexity Inelastic deformation of polymer flap results in creep over extended use 	♦ Canon

Nozzle Clearing Method

Nozzle	Description	Advontages	Disadisation	
Clearing method				Cyampies
Normal nozzle firing	All of the nozzles are fired periodically, before the ink has a chance to dry. When not in use the nozzles are sealed (capped) against air.	 ♦ No added complexity on the print head 	 ◆ May not be sufficient to displace dried ink 	 Most ink jet systems 101-1107, 1109-1112 1114, 1116, 1120, 1122 1123-1134, 1136-1145
	The nozzle firing is usually performed during a special clearing cycle, after first moving the print head to a cleaning station.			
Extra power to ink heater	In systems which heat the ink, but do not boil it under normal situations, nozzle clearing can be achieved by over-powering the heater and boiling ink at the nozzle.	 Can be highly effective if the heater is adjacent to the nozzle 	 Requires higher drive voltage for clearing May require larger drive transistors 	 Silverbrook, EP 0771 658 A2 and related patent applications
Rapid succession of actuator pulses	The actuator is fired in rapid succession. In some configurations, this may cause heat build-up at the nozzle which boils the ink, clearing the nozzle. In other situations, it may cause sufficient vibrations to dislodge clogged nozzles.	 Does not require extra drive circuits on the print head Can be readily controlled and initiated by digital logic 	 Effectiveness depends substantially upon the configuration of the inkjet nozzle 	 May be used with: 1101-1107, 1109-1111 1114, 1116, 1120, 1122 1123-1125, 1127-1134 1136-1145
Extra power to ink pushing actuator	Where an actuator is not normally driven to the limit of its motion, nozzle clearing may be assisted by providing an enhanced drive signal to the actuator.	 A simple solution where applicable 	 Not suitable where there is a hard limit to actuator movement 	 May be used with: 103, 1109, 1116, 1120 1123, 1124, 1125, 1127 1129, 1130, 1131, 1132 1139, 1140, 1141, 1142 1143, 1144, 1145

Acoustic	An ultrasonic wave is applied to the ink chamber. This wave is of an appropriate amplitude and frequency to cause sufficient force at the nozzle to clear blockages. This is easiest to achieve if the ultrasonic wave is at a resonant frequency of the ink cavity.	 A high nozzle clearing capability can be achieved May be implemented at very low cost in systems which already include acoustic actuators 	 High implementation cost if system does not already include an acoustic actuator 	• 1108, 1113, 1115, 1117 • 1118, 1119, 1121
Nozzle clearing plate	A microfabricated plate is pushed against the nozzles. The plate has a post for every nozzle. The array of posts	 Can clear severely clogged nozzles 	 Accurate mechanical alignment is required Moving parts are required There is risk of damage to the nozzles Accurate fabrication is required 	• Silverbrook, EP 0771 658 A2 and related patent applications
Ink pressure pulse	The pressure of the ink is temporarily increased so that ink streams from all of the nozzles. This may be used in conjunction with actuator energizing.	 May be effective where other methods cannot be used 	 Requires pressure pump or other pressure actuator Expensive Wasteful of ink 	 May be used with all IJ series ink jets
Print head wiper	A flexible 'blade' is wiped across the print head surface. The blade is usually fabricated from a flexible polymer, e.g. rubber or synthetic elastomer.	 Effective for planar print head surfaces Low cost 	 Difficult to use if print head surface is non-planar or very fragile Requires mechanical parts Blade can wear out in high volume print systems 	 ◆ Many ink jet systems
Separate ink boiling heater	A separate heater is provided at the nozzle although the normal drop eection mechanism does not require it. The heaters do not require individual drive circuits, as many nozzles can be cleared simultaneously, and no imaging is required.	 Can be effective where other nozzle clearing methods cannot be used Can be implemented at no additional cost in some inkjet configurations 	 Fabrication complexity 	• Can be used with many IJ series ink jets

NOZZLE PLATE CONSTRUCTION

Nozzle plate construction	Description	Advantages	Disadvantages	Examples
Electroformed nickel	A nozzle plate is separately fabricated from electroformed nickel, and bonded to the print head chip.	• Fabrication simplicity	 High temperatures and pressures are required to bond nozzle plate Minimum thickness constraints Differential thermal expansion 	 Hewlett Packard Thermal Inkjet
Laser ablated or drilled polymer	Individual nozzle holes are ablated by an intense UV laser in a nozzle plate, which is typically a polymer such as polyimide or polysulphone	 No masks required Can be quite fast Some control over nozzle profile is possible Equipment required is relatively low cost 	 Each hole must be individually formed Special equipment required Slow where there are many thousands of nozzles per print head May produce thin burrs at exit holes 	 Canon Bubblejet 1988 Sercel et al., SPIE, Vol. 998 Excimer Beam Applications, pp. 76-83 1993 Watanabe et al., USP 5,208,604
Silicon micro- machined	A separate nozzle plate is micromachined from single crystal silicon, and bonded to the print head wafer.	 ◆ High accuracy is attainable 	 Two part construction High cost Requires precision alignment Nozzles may be clogged by adhesive 	◆ K. Bean, IEEE Transactions on Electron Devices, Vol. ED-25, No. 10, 1978, pp 1185-1195 ◆ Xerox 1990 Hawkins et al., USP 4,899,181
Glass capillaries	Fine glass capillaries are drawn from glass tubing. This method has been used for making individual nozzles, but is difficult to use for bulk manufacturing of print heads with thousands of nozzles.	 No expensive equipment required Simple to make single nozzles 	 ◆ Very small nozzle sizes are difficult to form ◆ Not suited for mass production 	♦ 1970 Zoltan USP 3,683,212

Monolithic, surface micro- machined using VLSI lithographic processes	The nozzle plate is deposited as a layer using standard VLSI deposition techniques. Nozzles are etched in the nozzle plate using VLSI lithography and etching.	 High accuracy (<1 μm) Monolithic Low cost Existing processes can be used 	 Requires sacrificial layer under the nozzle plate to form the nozzle chamber Surface may be fragile to the touch 	 Silverbrook, EP 0771 658 A2 and related patent applications 1101, 1102, 1104, 1111 1112, 1117, 1118, 1120 1122, 1124, 1127, 1128 1129, 1130, 1131, 1132 1139, 1130, 1130, 1131 1138, 1139, 1140, 1141 1142, 1143, 1144
Monolithic, etched through substrate No nozzle plate	The nozzle plate is a buried etch stop in the wafer. Nozzle chambers are etched in the front of the wafer, and the wafer is thinned from the back side. Nozzles are then etched in the etch stop layer. Various methods have been tried to eliminate the nozzles entirely, to prevent nozzle clogging. These include thermal bubble mechanisms and acoustic lens mechanisms	 High accuracy (<1 μm) Monolithic Low cost No differential expansion No nozzles to become clogged 	 Requires long etch times Requires a support wafer Difficult to control drop position accurately Crosstalk problems 	 1103, 1105, 1106, 1107 1108, 1109, 1110, 1113 1114, 1115, 1116, 1119 1121, 1123, 1125, 1126 Ricoh 1995 Sekiya et al USP 5,412,413 1993 Hadimioglu et al EUP 550,192 1993 Elrod et al EUP
Trough Nozzle slit instead of individual nozzles	Each drop ejector has a trough through which a paddle moves. There is no nozzle plate. The elimination of nozzle holes and replacement by a slit encompassing many actuator positions reduces nozzle clogging, but increases crosstalk due to ink surface waves	 Reduced manufacturing complexity Monolithic No nozzles to become clogged 	 Drop firing direction is sensitive to wicking. Difficult to control drop position accurately Crosstalk problems 	+ 1135 + 1989 Saito et al USP 4,799,068

DROP EJECTION DIRECTION

Ejection direction	Description	Advantages	Disadvantages	Examples
Edge ('edge shooter')	Ink flow is along the surface of the chip, and ink drops are ejected from the chip edge.	 Simple construction No silicon etching required Good heat sinking via substrate Mechanically strong Ease of chip handing 	 Nozzles limited to edge High resolution is difficult Fast color printing requires one print head per color 	 Canon Bubblejet 1979 Endo et al GB-patent 2,007,162 Xerox heater-in-pit 1990 Hawkins et al USP 4,899,181 Tone-iet
Surface ('roof shooter')	Ink flow is along the surface of the chip, and ink drops are ejected from the chip surface, normal to the plane of the chip.	 No bulk silicon etching required Silicon can make an effective heat sink Mechanical strength 	 Maximum ink flow is severely restricted 	 Hewlett-Packard TIJ 1982 Vaught et al USP 4,490,728 1102, IJ11, IJ12, IJ20 1J22
Through chip, forward ('up shooter')	Ink flow is through the chip, and ink drops are ejected from the front surface of the chip.	 High ink flow Suitable for pagewidth print High nozzle packing density therefore low manufacturing cost 	 Requires bulk silicon etching 	 Silverbrook, EP 0771 658 A2 and related patent applications IJ04, IJ17, IJ18, IJ24 IJ27-IJ45
Through chip, reverse ('down shooter')	Ink flow is through the chip, and ink drops are ejected from the rear surface of the chip.	 High ink flow Suitable for pagewidth print High nozzle packing density therefore low manufacturing cost 	 Requires wafer thinning Requires special handling during manufacture 	 • 1001, 1103, 1105, 1106 • 1107, 1108, 1109, 1110 • 1113, 1114, 1115, 1116 • 1119, 1121, 1123, 1125 • 1126
Through actuator	Ink flow is through the actuator, which is not fabricated as part of the same substrate as the drive transistors.	 Suitable for piezoelectric print heads 	 Pagewidth print heads require several thousand connections to drive circuits Cannot be manufactured in standard CMOS fabs Complex assembly required 	Epson Stylus Tektronix hot melt piezoelectric ink jets

INK TYPE

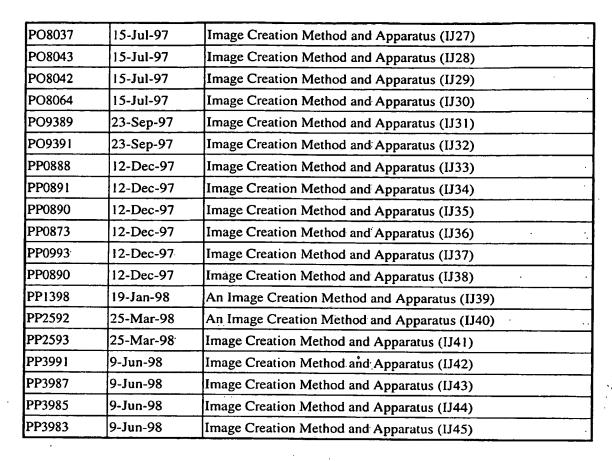

Ink type	Description	Advantages	Disadvantages	Examples
Aqueous, dye	Water based ink which typically contains: water, dye, surfactant, humectant, and biocide. Modern ink dyes have high water-	 Environmentally friendly No odor 	 Slow drying Corrosive Bleeds on paper May strikethrough 	 Most existing inkjets All IJ series ink jets Silverbrook, EP 0771 658 A2 and related
Aqueous, pigment	Water based ink which typically contains: water, pigment, surfactant, humectant, and biocide. Pigments have an advantage in reduced bleed, wicking and strikethrough.	 Environmentally friendly No odor Reduced bleed Reduced wicking Reduced strikethrough 	Slow drying Corrosive Pigment may clog nozzles Pigment may clog actuator mechanisms Cockles paper	Use 1102, 1104, 1121, 1126 1127, 1130 Silverbrook, EP 0771 658 A2 and related patent applications Piezoelectric ink-jets Thermal ink jets (with significant restrictions)
Methyl Ethyl Ketone (MEK)	MEK is a highly volatile solvent used for industrial printing on difficult surfaces such as aluminum cans.	 Very fast drying Prints on various substrates such as metals and plastics 	◆ Odorous◆ Flammable	• All IJ series ink jets
Alcohol (ethanol, 2- butanol, and others)	Alcohol based inks can be used where the printer must operate at temperatures below the freezing point of water. An example of this is in-camera consumer photographic printing.	 Fast drying Operates at sub-freezing temperatures Reduced paper cockle Low cost 	 Slight odor Flammable 	• All IJ series ink jets

				-
Phase change (hot melt)	The ink is solid at room temperature, and is melted in the print head before jetting. Hot melt inks are usually wax based, with a melting point around 80 °C. After jetting the ink freezes almost instantly upon contacting the print medium or a transfer roller.	 No drying time- ink instantly freezes on the print medium Almost any print medium can be used No paper cockle occurs No wicking occurs No bleed occurs No strikethrough occurs 	 High viscosity Printed ink typically has a 'waxy' feel Printed pages may 'block' Ink temperature may be above the curie point of permanent magnets Ink heaters consume power Long warm-up time 	 Tektronix hot melt piezoelectric ink jets 1989 Nowak USP 4,820,346 All IJ series ink jets
ĪĪ	Oil based inks are extensively used in offset printing. They have advantages in improved characteristics on paper (especially no wicking or cockle). Oil soluble dies and pigments are required.	 High solubility medium for some dyes Does not cockle paper Does not wick through paper 	 ◆ High viscosity: this is a significant limitation for use in inkjets, which usually require a low viscosity. Some short chain and multi-branched oils have a sufficiently low viscosity. ◆ Slow drying 	◆ All IJ series ink jets
Microemulsion	A microemulsion is a stable, self forming emulsion of oil, water, and surfactant. The characteristic drop size is less than 100 nm, and is determined by the preferred curvature of the surfactant.	 Stops ink bleed High dye solubility Water, oil, and amphiphilic soluble dies can be used Can stabilize pigment suspensions 	 Viscosity higher than water Cost is slightly higher than water based ink High surfactant concentration required (around 5%) 	 ◆ All IJ series ink jets

Ink Jet Printing

A large number of new forms of ink jet printers have been developed to facilitate alternative ink jet technologies for the image processing and data distribution system. combinations of ink jet devices can be included in printer devices incorporated part of the present invention. as Australian Provisional Patent Applications relating to these ink jets which are specifically incorporated by cross reference include:

We Claim:

5

10

1. A camera system for outputting deblurred images, said system comprising:

an image sensor for sensing an image;

a velocity detection means for determining any motion of said image relative to an external environment and to produce a velocity output indicative thereof;

a processor means interconnected to said image sensor and said velocity detection means and adapted to process said sensed image utilising the velocity output so as to deblurr said image and to output said deblurred image.

- 2. A camera system as claimed in claim 1 wherein said processor means is connected to a printer means for immediate output of said deblurred image.
- 3. A camera system as claimed in claim 1 wherein said camera system is a portable handheld camera device.
- 4. A camera system as claimed in claim 1 wherein said velocity detection means comprises an accelerometer.
- 5. A camera system as claimed in claim 4 wherein said accelerometer comprises a mircro-electro mechanical device.

ADD AI

Abstract

A camera system is disclosed having the ability to overcome the effects of motion blur. The camera system includes an image sensor; a velocity detection means such as a MEMS accelerometer for determining any motion of the image relative to an external environment; a processor means interconnected to the image sensor and the velocity detection means and adapted to process the sensed image so as to deblurr the image and to output the deblurred image to a printer means.
